

Meal Plan

Thick & Fit Fitness

Introduction

Dear Erilyn,

Here are some recommendations for a healthy eating plan based on the information you have provided. This takes into account your preferences and lifestyle, to help you successfully achieve your goal of losing weight.

This meal plan consists of a number of recipes divided into suggested meal times. You are welcome to freely choose between these meals, or just select a few that you enjoy. In addition, you can find some tips below to help you adhere to your plan.

Please note that this meal plan only serves as a suggestion of healthy eating patterns and is not intended to replace dietary counseling from a dietitian, nutritionist, or medical professional. Use of all meal plans is at your own risk. You should always carefully review the contents of your meal plan for anything that you may be allergic or intolerant to. Following a meal plan does not guarantee any particular health outcome, including weight loss. If you have specific questions about your health or your individual nutrient needs, please consult your medical provider, especially if you are being treated for a medical condition.

Enjoy these recipes and if you have any questions about this plan, please don't hesitate to reach out.

All the best!

Yours sincerely,

Thick & Fit

Meal plan structure and scientific background

Based on the information you have provided, your total daily energy intake and recommended macronutrient distribution (protein, carbohydrate, and fat) have been calculated. These recommendations are based on well-established and widely accepted academic principles including [Basal Metabolic Rate](#) (BMR), Total Daily Energy Expenditure that incorporates BMR and daily [activity level](#), and recommended [macronutrient](#) distributions.

If you eat the recommended amount of calories, your weight will remain stable. However, because you would like to lose weight, your body should be in a caloric deficit. In order to meet your goal, it's recommended to consume 1700 calories per day.

As you want to lose weight, your recommended macronutrient distribution is as follows:

Macronutrient distribution:

Daily energy intake	Protein	Carbohydrate	Fat
1700 kcal	39%	33%	29%

Daily intake:

- Breakfast - 395 kcal
- Lunch - 465 kcal
- Snack 1 - 295 kcal
- Dinner - 550 kcal

Taking into account the energy density of each macronutrient - 4.1 calories in one gram of carbohydrate, 4.1 calories in one gram of protein, and 8.8 calories in one gram of fat - it is recommended to consume approximately 162 grams of protein, approximately 135 grams of carbs and approximately 55 grams of fat per day. These recommendations form the basis for the recipes in your meal plan.

Tips to help you succeed

Weighing ingredients

It's important to note that all ingredient quantities in the recipes are described in raw weight, unless otherwise stated. Therefore if you want to weigh ingredients, measure them before cooking when you can. Make sure to only weigh the part of the food that you're actually going to eat.

Herbs, spices, and similar ingredients

Spices and flavoring are included in many recipes and are intended to provide extra flavor to your dishes and make them more enjoyable. If you dislike any flavoring or spices, feel free to replace or omit them from your meals. If you have any allergies or specific dietary preferences, be diligent when reading labels as some spice mixes and sauces may contain various allergens or additives.

Meal preparation for multiple portions

Preparing meals in larger quantities can reduce your time spent in the kitchen. Multiply the recipe's ingredient amounts by the number of meals you want to consume, and season it to your liking. After preparation, try to evenly portion the food into the number of meals you need. Store the meals in tupperware in the fridge if it is to be consumed within a few days. Otherwise, store the tupperware in the freezer for later consumption. Keep in mind that certain foods (e.g. cold pasta salads, sandwiches) are better kept in the fridge than frozen for later.

Sustainability

Preparing meals in larger portions can also be a useful tool in preventing food waste. Try using as much of the whole ingredient as possible and aim to buy local and seasonal ingredients where possible. It can also be advantageous to prioritize recipes in your meal plan based on what you have already available at home. For ingredients you don't have readily available, here is a [guide](#) that you can use to swap ingredients that have a similar macronutrient profile.

Staying on track

It is recommended that you follow the recipes as they are written to the best of your ability since they are designed to help you achieve your goals. With experimentation, you will be able to find the eating pattern that works for your schedule and body. Some people notice that spreading their meals evenly throughout the day helps them maintain energy levels, while others prefer eating larger meals less frequently. Feel free to be flexible with your meal structure, there is nothing wrong with e.g. eating a breakfast meal in the evening, if this suits you and your time best. From a purely physiological perspective, it's what you eat on a weekly basis that determines your results, not what you eat on a meal to meal basis.

More information on dietary recommendations

If you are interested in learning more about nutritional needs and dietary advice for different dietary preferences, including vegetarian/vegan and pregnancy, please consult the following resources:
